

Healthcare Quality Reporting Program

**HEART FAILURE**

Methods

The heart failure data is a composite measure based on 2 individual indicators as reported on the CMS hospital compare website <http://www.hospitalcompare.hhs.gov>.

Heart Failure Quality Indicators Included in the Composite Measure
Percent of patients given assessment of Left Ventricular Function (LVF)
Percent of patients given ACE inhibitor or ARB for Left Ventricular Systolic Dysfunction (LVSD)

**Methodology**

The numerators of all individual performance measures included for the condition are summed to determine the composite numerator. The denominators of all the individual performance measures included for the condition are summed to determine the composite denominator. The composite numerator is divided by the composite denominator to determine the composite performance rate. The state average rate is computed by summing all hospitals composite numerators and composite denominators, then dividing the numerator sum by the denominator sum.

**Statistical Significance**

To determine if a rate is statistically significant, 95% confidence intervals were computed around each individual hospital rate and compared to the RI state average. The following table lists the statistical significance for each RI hospital's rates compared to the state average.

Heart Failure State Average, July 2009 – June 2010: **97.5%**

Rate is statistically higher than the state average	Rate (%)	Rate is statistically the same as the state average	Rate (%)	Rate is statistically lower than the state average	Rate (%)
Kent	98.1	Newport	97.7	Memorial	95.4
Landmark	99.2	Rhode Island	97.3	Our Lady of Fatima	96.7
Miriam	98.4			Roger Williams	93.9
South County	100.0			Westerly	95.2
